Discussion:
Why study computer graphics?
What is computer graphics?

**com•put•er   graph•ics** /kəmˈpyʊədər ˈɡraffitiks/ *n.*
The use of computers to synthesize and manipulate visual information.
Why *visual* information?

About 30% of brain dedicated to visual processing...

...eyes are highest-bandwidth port into the head!
Movies

Jurassic Park (1993)
Movies

The Matrix (1999)
Computer games

Uncharted 4 (Naughty Dog, 2016)

This image is rendered in real-time on a modern GPU
Computer games

Assassin’s Creed Odyssey (Ubisoft 2018)
Supercomputing for games

NVIDIA Titan V GPU
(~ 15 TFLOPs fp32)
Virtual reality experiences
Augmented reality

Microsoft Hololens augmented reality headset concept
Illustration

Indonesian cave painting (~38,000 BCE)
Digital illustration

Meike Hakkart
http://maquenda.deviantart.com/art/Lion-done-in-illustrator-327715059
Graphical user interfaces

Ivan Sutherland, “Sketchpad” (1963)

Doug Engelbart Mouse
Modern graphical user interfaces

2D drawing and animation are ubiquitous in computing. Typography, icons, images, transitions, transparency, ... (all rendered at high frame rate for rich experience)
Digital photography

NASA | Walter Iooss | Steve McCurry
Harold Edgerton | NASA | National Geographic
Ubiquitous imaging

Cameras everywhere
Computational cameras

Panaromic stitching, HDR photos, light field cameras, …
Imaging for mapping

Maps, satellite imagery, street-level imaging, ...
Computer aided design

SolidWorks

SketchUp

For mechanical, architectural, electronic, optical, ...
Product design and visualization

Ikea - 75% of catalog is rendered imagery
Architectural design

Bilbao Guggenheim, Frank Gehry
Visualization

Science, engineering, medicine, journalism, …
Simulation

Driving simulator
Toyota Higashifuji Technical Center

da Vinci surgical robot
Intuitive Surgical

Flight simulator, driving simulator, surgical simulator, …
Simulation for training models

Al Habitat: simulator for training AI agents

Carla: autonomous driving simulator

AI Habitat enables training of embodied AI agents (virtual robots) in a simulated environment before transferring the learned skills to reality. This empowers a parallel training of real agents with real datasets (e.g., ImageNet, COCO, VQA) to embodied AI where agents act before active perception, long-term planning, learning from interactions with a rich environment.

Why the name Habitat? Because that's where AI agents live 😊

Habitat is a platform for embodied AI research that consists of Habitat-Sim.

Habitat-Sim

A flexible, high-performance 3D simulator with configurable agent handling (with built-in support for MatterPort3D, Gibson, Replica, and others) and the Matterport3D dataset, Habitat-Sim achieves several thousand frames per second on consumer hardware.
3D fabrication
Foundations of computer graphics

- All these applications demand **sophisticated** theory and systems

- Science and mathematics
  - Physics of light, color, optics
  - Math of curves, surfaces, geometry, perspective, ...
  - Sampling

- Systems
  - Parallel, heterogeneous processing
  - Graphics-specific programming systems
  - Input/output devices

- Art and psychology
  - Perception: color, stereo, motion, image quality, ...
  - Art and design: composition, form, lighting, ...
ACTIVITY: modeling and drawing a cube

- Goal: generate a realistic drawing of a cube
- Key questions:
  - *Modeling*: how do we describe the cube?
  - *Rendering*: how do we then visualize this model?
ACTIVITY: modeling the cube

- Suppose our cube is...
  - centered at the origin (0,0,0)
  - has dimensions 2 x 2 x 2

- QUESTION: What are the coordinates of the cube vertices?
  A: ( 1, 1, 1 )   E: ( 1, 1,-1 )
  B: (-1, 1, 1 )   F: (-1, 1,-1 )
  C: ( 1,-1, 1 )   G: ( 1,-1,-1 )
  D: (-1,-1, 1 )   H: (-1,-1,-1 )

- QUESTION: What about the edges?
  AB, CD, EF, GH,
  AC, BD, EG, FH,
  AE, CG, BF, DH
ACTIVITY: drawing the cube

Now have a digital description of the cube:

**VERTICES**
- A: (1, 1, 1)
- B: (-1, 1, 1)
- C: (1, -1, 1)
- D: (-1, -1, 1)
- E: (1, 1, -1)
- F: (-1, 1, -1)
- G: (1, -1, -1)
- H: (-1, -1, -1)

**EDGES**
- AB, CD, EF, GH
- AC, BD, EG, FH
- AE, CG, BF, DH

How do we draw this 3D cube as a 2D (flat) image?

Basic strategy:
1. Project 3D vertices to 2D points in the image
2. Connect 2D points with straight lines

...Ok, but how?
Perspective projection

- Objects look smaller as they get further away ("perspective")
- Why does this happen?
- Consider simple ("pinhole") model of a camera:
For those that didn’t do this in grade school

http://jdaniel4smom.com/2017/06/pinhole-camera.html
Perspective projection: side view

- Where exactly does a point $p = (x, y, z)$ end up on the image?
- Let’s call the image point $q = (u, v)$
Perspective projection: side view

- Where exactly does a point \( p = (x, y, z) \) end up on the image?
- Let’s call the image point \( q = (u, v) \)
- Notice two similar triangles:

Assume camera has unit size, coordinates relative to pinhole \( c \)
- Then \( v/1 = y/z \), i.e., vertical coordinate is just the slope \( y/z \)
- Likewise, horizontal coordinate is \( u = x/z \)
ACTIVITY: now draw image made by pinhole camera

- Need 12 volunteers
  - each person will draw one cube edge
  - assume camera is at point $c=(2,3,5)$
  - convert $(X,Y,Z)$ of both endpoints of edge to $(u,v)$:
    1. subtract camera $c$ from vertex $(X,Y,Z)$ to get $(x,y,z)$
    2. divide $x$ and $y$ by $z$ to get $(u,v)$—write as a fraction
  - draw line between $(u_1,v_1)$ and $(u_2,v_2)$

**VERTICES**

A: (1, 1, 1)  E: (1, 1, -1)
B: (-1, 1, 1)  F: (-1, 1, -1)
C: (1, -1, 1)  G: (1, -1, -1)
D: (-1, -1, 1)  H: (-1, -1, -1)

**EDGES**

AB, CD, EF, GH,
AC, BD, EG, FH,
AE, CG, BF, DH
ACTIVITY: how did we do? *

2D coordinates:
A: \((1/4, 1/2)\)
B: \((3/4, 1/2)\)
C: \((1/4, 1)\)
D: \((3/4, 1)\)
E: \((1/6, 1/3)\)
F: \((1/2, 1/3)\)
G: \((1/6, 2/3)\)
H: \((1/2, 2/3)\)

* keep in mind, this image is mirrored since it is a pinhole projection. Mirror the result and you get...

Stanford CS248, Winter 2020
But wait…

How do we draw lines on a computer?
CNC sharpie drawing machine ;-)
Oscilloscope
Cathode ray tube

Frame buffer: memory for a raster display

image = “2D array of colors”
Output for a raster display

- Common abstraction of a raster display:
  - Image represented as a 2D grid of “pixels” (picture elements)
  - Each pixel can have a unique color value

** Kayvon will strongly challenge this notion of a pixel “as a little square” next class. But let’s go with it for now. ;-)

Stanford CS248, Winter 2020
Flat panel displays

Low-Res LCD Display

High resolution color LCD, OLED, ...
Close up photo of pixels on a modern display
LCD screen pixels (closeup)

iPhone 6S

Galaxy S5
LCD (liquid crystal display) pixel

- Principle: block or transmit light by twisting polarization

- Illumination from backlight (e.g. fluorescent or LED)

- Intermediate intensity levels by partial twist

[Image credit: H&B fig. 2-16]
DMD projection display

Array of micro-mirror pixels

DMD = Digital micro-mirror device
DMD projection display

Array of micro-mirror pixels

DMD = Digital micro-mirror device
What pixels should we color in to depict a line?

“Rasterization”: process of converting a continuous object (a line, a polygon, etc.) to a discrete representation on a “raster” grid (pixel grid)
What pixels should we color in to depict a line?

Light up all pixels intersected by the line?
What pixels should we color in to depict a line?

Diamond rule (used by modern GPUs):
light up pixel if line passes through associated diamond
What pixels should we color in to depict a line?

Is there a right answer?
(consider a drawing a “line” with thickness)
How do we find the pixels satisfying a chosen rasterization rule?

- Could check every single pixel in the image to see if it meets the condition...

  - $O(n^2)$ pixels in image vs. at most $O(n)$ “lit up” pixels

  - *must* be able to do better! (e.g., seek algorithm that does work proportional to number of pixels in the drawing of the line)
Incremental line rasterization

- Let's say a line is represented with integer endpoints: \((u_1,v_1), (u_2,v_2)\)
- Slope of line: \(s = (v_2-v_1) / (u_2-u_1)\)
- Consider an easy special case:
  - \(u_1 < u_2, \ v_1 < v_2\) (line points toward upper-right)
  - \(0 < s < 1\) (more change in \(x\) than \(y\))

\[
v = v_1; \\
\text{for}( \ u=u_1; \ u<=u_2; \ u++ \ ) \\
\{ \\
\quad v += s; \\
\quad \text{draw}( \ u, \ \text{round}(v) \ ) \\
\}
\]

Common optimization: rewrite algorithm to use only integer arithmetic (Bresenham algorithm)
Line drawing of cube

2D coordinates:

A: \((1/4, 1/2)\)
B: \((3/4, 1/2)\)
C: \((1/4, 1)\)
D: \((3/4, 1)\)
E: \((1/6, 1/3)\)
F: \((1/2, 1/3)\)
G: \((1/6, 2/3)\)
H: \((1/2, 2/3)\)

* keep in mind, this image is mirrored since we simulated the result of pinhole projection
We just rendered a simple line drawing of a cube.

But to render more realistic pictures (or animations) we need a much richer model of the world.

surfaces
motion
materials
lights
cameras
2D shapes

Realistic lighting environments

Wall-E, (Pixar 2008)
Animation: modeling motion

Drawing by hand was a lot of work! Probably better to use a computer, especially if we want more complexity/realism. Suppose we want a more complicated object (e.g., mug). How many sample points? Which lines get connected? Should we even keep using lines? (MODELING) What about making it more realistic? Lighting, shading, shadows, occlusion, etc. (RENDERING) What if we want to make a movie? Need to describe motion somehow (ANIMATION).
Physically-based simulation of motion

Course Logistics
About this course

- A broad overview of major topics and techniques in interactive computer graphics: geometry, rendering, animation, imaging

- Learn by implementing:
  - Focus on implementing fundamental data structures and algorithms that are reused across all areas of graphics
Getting started

- Sign up for an account on the course web site
  - http://cs248.stanford.edu

- Sign up for the course on Piazza

- There is no textbook for this course, but please see the course website for references (there are some excellent graphics textbooks)
Course programming assignments

1. 2D drawing (2 weeks)

2. Geometry editing (2 weeks)

3. Materials and lighting in a 3D renderer (2 weeks)

4. Self-selected project
   extend existing project, take on optional animation project, choose your own (~3 weeks)
Assignments / Grading

- **(40%)** Three programming assignments
  - In teams of up to two students (yes, you can work alone if you wish)

- **(10%)** Written exercises (weekly)
  - Released on Tues night, due Friday 10am (starting next week)
  - Graded on participation only

- **(25%)** Final exam
  - Given in week 9 of the course

- **(25%)** Self-selected final project
  - Extend an earlier assignment, or do your own thing!
The course web site

We have no textbook for this class and so the lecture slides and instructor/TA/student discussions on the web are the primary course reference

Perspective projection

- Objects look smaller as they get further away ("perspective")
- Why does this happen?
- Consider simple ("pinhole") model of a camera:

3D object

2D image

"Add private note" button: You can add notes to yourself about this slide here.

Slide comments and discussion

Question: During class Keenan asked a question about why do objects look smaller when they are viewed at a distance. I liked one of the arguments made because it appealed to the angle subtended by an object. Could someone elaborate on that here?
Thought question for next time:
What does it mean for a pixel to be covered by a triangle?

Question: which of these four triangles “cover” this pixel?
See you next time!

Next time, we’ll talk about drawing a triangle
- And it’s a lot more interesting than it might seem…
- Also, what’s up with these “jagged” lines?

Slide acknowledgements:
